

TabLift

Retractable motorized mount for tablets

The TabLift is a retractable motorized holder for tablets that has been designed for desk integration: a motorized docking station with optimal powering. It allows to hide a tablet within the furniture thanks to a silent and harmonic motorized movement that discreetly conceals it when not in use. The rise and retraction movements are activated via push buttons located on the brushed stainless steel cover plate, RS-422, GPI contact closure or the App AHlink. The tablet rises and tilts in an angle of 20° and it can be manually rotated from 0° to 90° allowing it to be placed both vertically or horizontally and the fixing mechanism ensures its steady position.

Optionally, the system is available with an embedded power connector from each tablet manufacturer.

Advanced top features

- Motorized holder for tablets
- Revolving mechanism for landscape and portrait positions
- Brushed stainless steel passive cover plate
- Interactive setup display for address setup, configuration and diagnose
- Serial control and remote diagnosis
- Compatible wireless connectivity for setup, and control via wireless App.
